Predviđanje preraspodele tiketa sistema podrške

Seminarski rad u okviru kursa Mašinsko Učenje
Matematički Fakultet, Beograd

Tatjana Kunić 1084/2022

Septembar 2023

Osnovni pojmovi

- Sistem podrške (eng. help desk) - informacioni sistem za prijavu tehničkih problema softvera
- Korisnici softvera prijavljuju probleme otvaranjem tiketa (eng. ticket)
- Može se desiti da je tiket potrebno ponovo zadužiti (eng. reassign) na neku drugu osobu (ili organizaciju)

Overview
Critical Incident Map
Problem
Change
Configuration

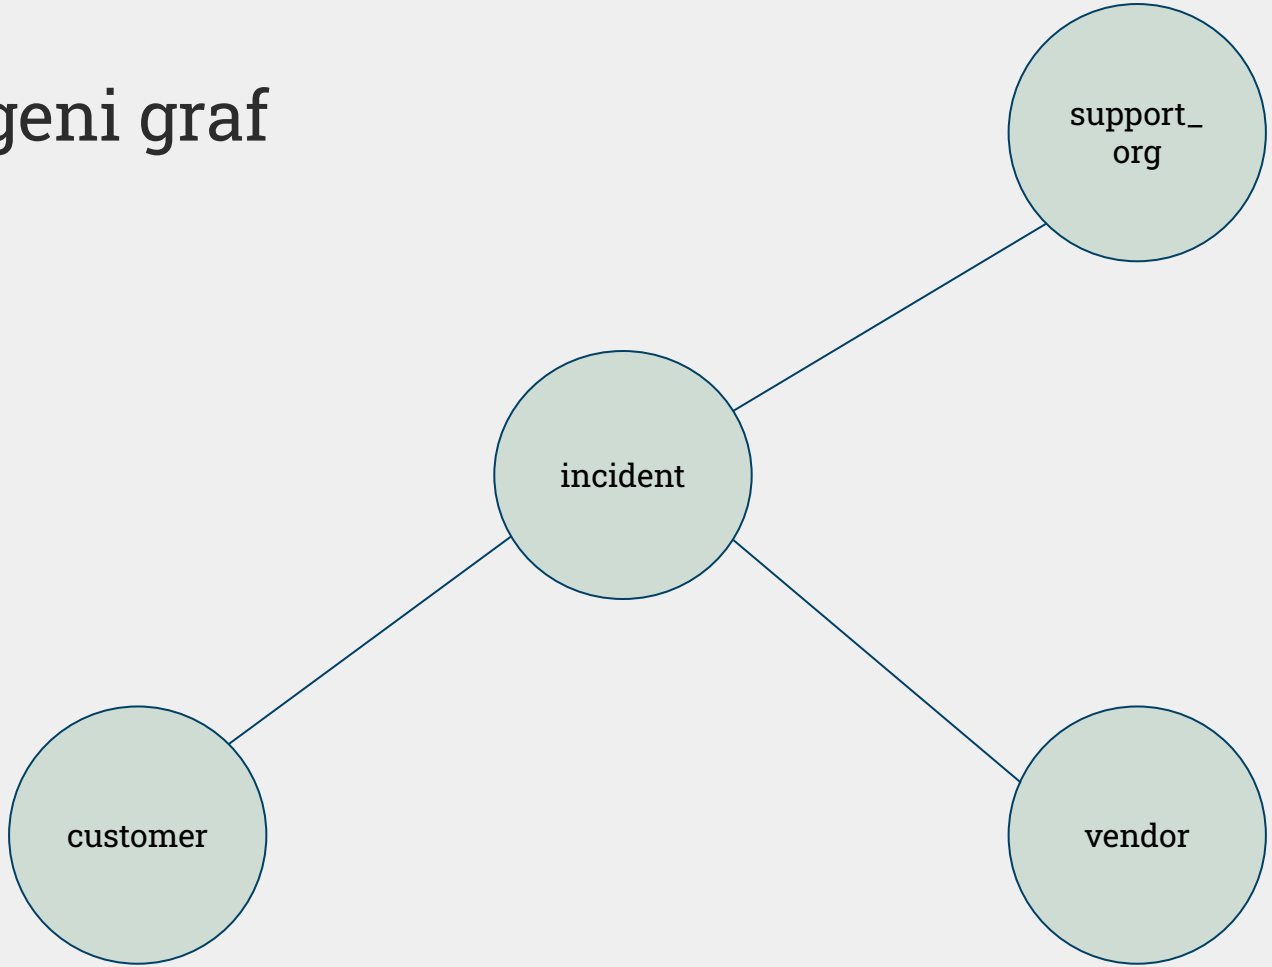
Motivacija

- U interesu svake kompanije je brzo razrešavanje prijavljenih korisničkih problema
- Prebacivanje odgovornosti sa jedne osobe na drugu rezultuje povećanju potrebnog vremena za rešavanje problema, kao i povećanju troškova
- Brza i precizna identifikacija složenosti problema je neophodna

Modelovanje skupa podataka

- Podaci obično predstavljeni u relacionom obliku
- Mnogi upiti nad podacima nisu poznati *apriori*
- Spajanje tabela je računski zahtevna operacija
- Grafovski modeli podataka pokazuju bolje performanse kad je upite potrebno izvršavati *ad hoc**

Heterogeni graf



Atributi

- Svaki čvor ima svoje atribute
- Čvor incident sadrži atribut ***reassigned*** koji indikuje da li je problem prebačen na drugu osobu i on je ciljna promenljiva
- Cilj: Pridružiti čvoru incident klasu 1 ili 0

Grafovske neuronske mreže

- Za čvor u grafa $G = (V, E)$ naredni sloj grafovske neuronske mreže se računa kao: $h_u = x_u W^T$

- Više ima smisla posmatrati čvorove u odnosu na svoje susede: $h_u = \sum_{v \in N_u} x_v W^T$

- Čvorovi sa većim brojem suseda brže šire informacije kroz mrežu u odnosu na one sa manjim brojem suseda

- Slojevi grafovske konvolutivne mreže za čvor u uključuju i vrstu normalizacije gde se daju veće težine čvorovima sa malim brojem suseda:

$$h_u = \sum_{v \in N_u} \frac{1}{\sqrt{deg(u)}\sqrt{deg(v))}} x_v W^T$$

GraphSAGE

- GNN arhitektura koja pokazuje bolje rezultate za velike grafove
- Za svaki čvor koristi se samo podskup skupa suseda unapred određene veličine
- Agregacija slojeva (može biti prosek, LSTM jedinica, *pooling*)

$$h_u^k = \sigma(W \cdot MEAN(\{h_u^{k-1}\} \cup \{h_v^{k-1}, \forall v \in N(u)\}))$$

Učenje na heterogenim grafovima

- Različiti tipovi čvorova imaju različite atribute i dimenzije
- Tokom učenja uzimamo u obzir i relacije među čvorovima
- Želimo umesto pojedinačnih čvorova da posmatramo par čvorova (različitih tipova)
- Neophodan novi sloj neuronske mreže za svaku relaciju

```python
class GCN(torch.nn.Module):
    def __init__(self, hidden_channels, out_channels):
        super().__init__()
        self.conv1 = SAGEConv((-1, -1), hidden_channels[0], aggr='mean')
        self.conv2 = SAGEConv((-1, -1), hidden_channels[1], aggr='mean')
        self.conv3 = SAGEConv((-1, -1), out_channels, aggr='mean')

    def forward(self, x, edge_index):
        x = F.relu(self.conv1(x, edge_index))
        x = F.relu(self.conv2(x, edge_index))
        x = F.softmax(self.conv3(x, edge_index), dim=1)

        return x

gcn = GCN(hidden_channels=[256, 128], out_channels=2)
gcn = to_hetero(gcn, data.metadata(), aggr='sum')
optimizer = torch.optim.Adam(gcn.parameters(), lr=0.001, weight_decay=5e-4)
```

```
GraphModule(
  (conv1): ModuleDict(
    (incident__assigned__support_org): SAGEConv((-1, -1), 256, aggr=mean)
    (incident__assigned__vendor): SAGEConv((-1, -1), 256, aggr=mean)
